This invention relates to an amplifier circuit having high efficiency and low distortion, and more particularly to an amplifier circuit suitable for a high frequency band. FIG. 1 shows a block diagram of an amplification stage of a variable gain amplifier utilizing a MOS field effect transistor (MOSFET) as a first amplifier, and a junction field effect transistor (JFET) as a second amplifier. In FIG. 1, reference numeral 1 denotes a control circuit having the function of controlling the gain of the amplification stage. Reference numeral 2 denotes a first amplifying MOSFET of the first amplifier, 3 a control input terminal, 4 a control gate of the MOSFET 2, 5 an input terminal, 6 an output terminal, and 7 a junction field effect transistor (JFET). 8 is an output terminal of the amplification stage. In the above-mentioned amplification stage, the MOSFET 2 and the JFET 7 are connected in series between the input terminal 5 and the output terminal 6, and a gate bias of the MOSFET 2 is controllable by a control signal applied to the control gate 4. With the MOSFET 2 and the JFET 7 connected in series, the amplification stage operates as a JFET amplifier, and thus a positive current control characteristic of a JFET can be obtained. Therefore, the gain of the amplification stage can be controlled by the control signal applied to the control gate 4, whereby a high gain operation as an emitter follower or a resistor-emitter follower characteristic may be obtained. In this case, however, the characteristics of the MOSFET 2

program makes it easy to view your images from your computer, create photo books, frame and print photos, sign documents digitally, and share items.
