5 years ago as requested and thanks for your shared advise.. your email can be forwarded directly to our office. i will invite you the receipt of the documents and the payment in your mail. . 5 years agoSuch a pressure regulating valve is known from DE 10 2004 043 032 B3, in which a first opening is in an axial direction in the direction of a first rotational axis and an oblique second opening is provided in the direction of a second rotational axis perpendicular to the first rotational axis. The second opening is in each case provided at an angle of approximately 45° with respect to the first opening. Such an angle of 45° is selected in order to reduce a leakage cross section as a result of the asymmetric structure. A disadvantage of the known valve is that it does not provide satisfactory pass-through stability. Further pressure regulating valves are known from DE 102 49 490 B4 or DE 102 49 489 B4. The present invention is directed to a pressure regulating valve of the aforementioned type, which is suitable for maintaining a variable differential pressure and a variable volume flow in the passage between the first and the second opening at a stable or constant level. In this respect, DE 102 49 490 B4 describes a pressure regulating valve, which has a first and a second valve chamber, in which a valve body having a second opening is located in an axial direction and, in the closed state of the pressure regulating valve, is non-rotatably mounted on a valve seat in the valve body and is provided with a sealing edge, which is located between the second opening and a first opening of the valve body. A valve body of the pressure regulating valve has, in the closed state of the pressure regulating valve, a second opening, which is arranged at a height which is higher than that of the first opening and which is formed by way of two-part support beams on the valve body. Furthermore, the pressure regulating valve has a chamber, which is arranged on the inside of the valve body and which is delimited by the first opening. The chamber is provided with pressure medium inlet and outlet openings and has an inner space for receiving a pressure medium, which is located on the side, which faces the valve seat when the pressure regulating valve is closed. The inner space is connected with the valve chamber via a clearance gap, which extends from the bottom of the first opening to the bottom of the chamber. The chamber is connected with the first opening via a bore, which

At least, that's what the FDA and Health Canada are suggesting. As per the FDA's announcement, it has approved the creation of two companies to develop robotic exoskeletons that can help people with lower limbs injuries such as polio. The companies can also be used to help people with spinal cord injuries and other musculoskeletal problems, the FDA said. "Robotic exoskeletons are a promising new technology that could have far-reaching and revolutionary effects on people with physical challenges," David Graham, acting director of the FDA's Office of Device Evaluation, said. The two companies will also need to undergo the testing processes to gain their approvals, as per the FDA's announcement. Robotic exoskeletons are a medical device that help the wearer remain stable and comfortable while walking, with the movements provided by the robot. Robotic exoskeletons are being developed as part of DARPA's Revolutionizing Prosthetics project, which aims to develop a smart bionic limb that can be operated remotely. The device has to be controlled by software installed in the brain, which will use different types of sensors to gauge the wearer's physical movement and provide it to the

BUNAC Global Alumni Network Web Hosting. This is My Story I've never been able to write a story to save my life, but I can write this one. It's a story of my mom and dad, and of their old car, known by most people to be a "classic". It's an old story that sounds like a "Good will to men" song from the '60s. It's a story that I have carried with me for 44 years of life, and a story I'm convinced is a good one. It's not a musical but I hope you will not mind if I share it with you. It's not an autobiography but, as you listen, I hope you will see why it's taken me so long. It's a story about the way I have been raised by my parents, and it's a story about a car I call "Smarty". CHAPTER 1 My dad was an older gentleman who often carried himself with the manner of a man who was thinking a lot, and who usually didn't seem to notice anything about anything. He often gave a hint of a good time by talking about an old car we knew as "Smarty". It was what my dad called an old Chevy, what he called old was also a good word to describe most of the car's interior. Smarty was a 1962 Chevy Impala with a 327 engine, a speedometer that worked but wouldn't read a steady speed, a spare tire in the trunk, and a radio that didn't work very well. Smarty's springs were shot, but it had lots of character, and my dad loved it. My mother was young and tall and slender, with beautiful blue eyes, pale skin, and a sweet, sunny disposition that I was convinced kept dad from losing his patience when she was around. She was pretty much always around, in fact, and she took pride in my looks, my athletic activities, and my grades. She often described me as being "the best-looking thing that's ever walked on two legs". I usually smiled and let her believe her compliments. I
